Term Bioinformatics

Term **Bioinformatics** was invented by Paulien Hogeweg (Полина Хогевег) and Ben Hesper in 1970 as "the study of informatic processes in biotic systems".

Paulien Hogeweg is a Dutch theoretical biologist and complex systems researcher studying biological systems as dynamic information processing systems at many interconnected levels.

Definitions of what is Bioinformatics:

Bioinformatics is the use of IT in biotechnology for the data storage, data warehousing and analyzing the DNA sequences. In Bioinformatics knowledge of many branches are required like biology, mathematics, computer science, laws of physics & chemistry, and of course sound knowledge of IT to analyze biotech data. Bioinformatics is an interdisciplinary field that develops and improves upon methods for storing, retrieving, organizing and analyzing biological data. A major activity in bioinformatics is to develop software tools to generate useful

The mathematical, statistical and computing methods that aim to solve biological problems using DNA and amino acid sequences and related information.

Bioinformatics development of computer to analyze biology for example ingredients and metabolites

Bioinformatics: Research, development, or application of computational tools and approaches for expanding the use of biological, medical, behavioral or health data, including those to acquire, store, organize, archive, analyze, or visualize such data.

<http://www.bisti.nih.gov/CompuBioDef.pdf>

My additions:

- 1. Bioinformatics is a SCIENCE**
- 2. Not only to develop algorithms, store, retrieve, organize and analyze biological data but to CURATE data**

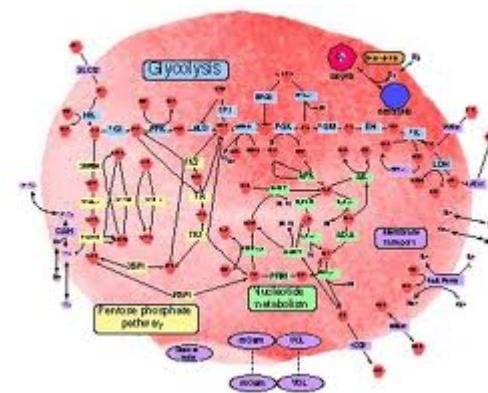

Bioinformatics is being used in following fields:

- ➔ Microbial genome applications
- ➔ Molecular medicine
- ➔ Personalised medicine
- ➔ Preventative medicine
- ➔ Gene therapy
- ➔ Drug development
- ➔ Antibiotic resistance
- ➔ Evolutionary studies
- ➔ Waste cleanup
- ➔ Biotechnology
- ➔ Climate change Studies
- ➔ Alternative energy sources
- ➔ Crop improvement
- ➔ Forensic analysis
- ➔ Bio-weapon creation
- ➔ Insect resistance
- ➔ Improve nutritional quality
- ➔ Development of Drought resistant varieties
- ➔ Veterinary Science

Microbial genome applications

- ➔ Genome assembly
- ➔ Re-sequencing
- ➔ Comparative analysis
- ➔ Evolutionary studies
- ➔ Antibiotic resistance
- ➔ Waste cleanup
- ➔ Biotechnology

Genome Assembly

- Genome assembly is a very complex computational problem due to enormous amount of data to put together and some other reasons.
- Ideally an assembly program should produce one contig for every chromosome of the genome being sequenced. But because of the complex nature of the genomes, the ideal conditions just never possible, thus leading to gaps in the genome.

De Novo assembly - puzzle without the picture

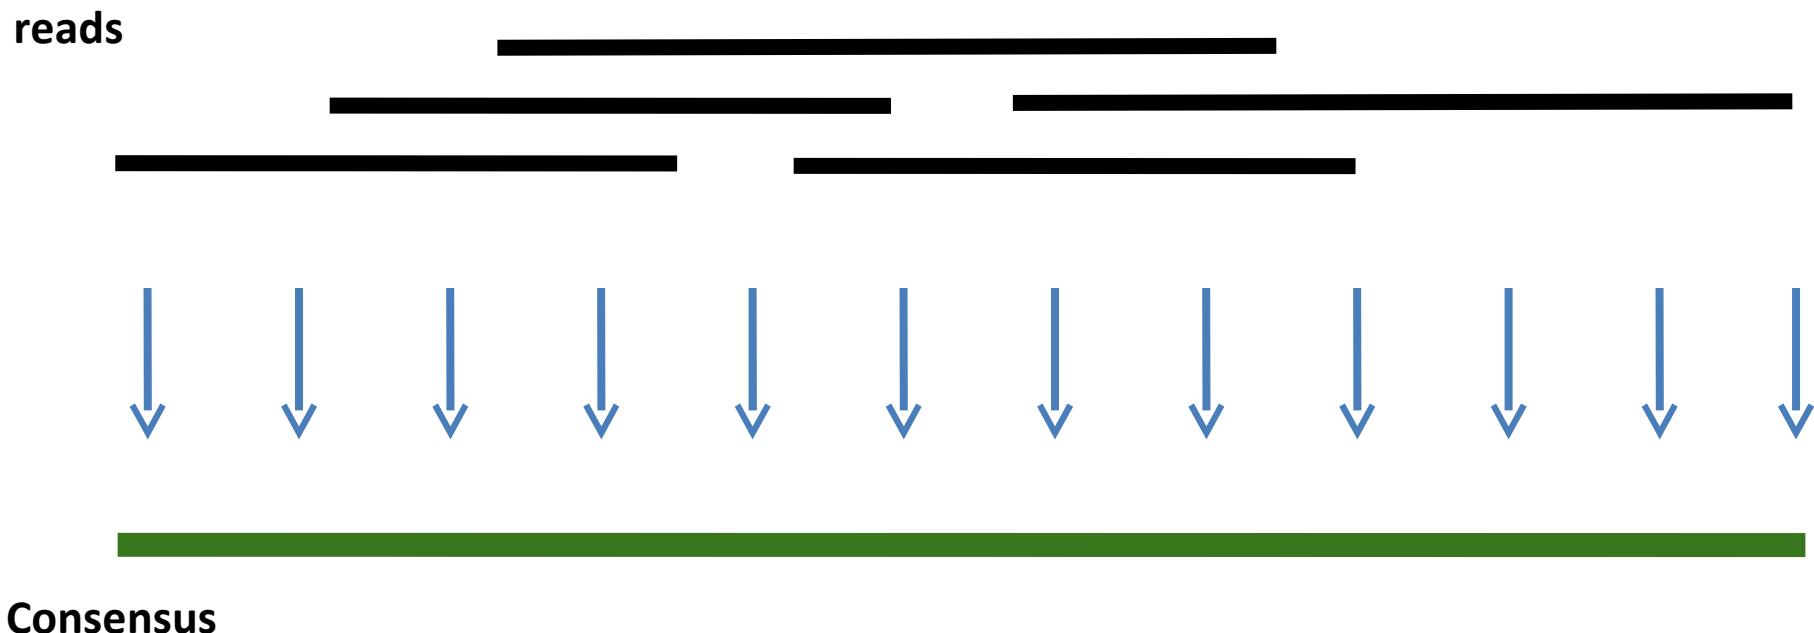

Assembly Challenges

- Presence of **repeats**. Repeats are identical sequences that occur in the genome in different locations and are often seen in varying lengths and in the multiple copies. There are several types of repeats: tandem repeats or interspersed repeats. The reads originating from different copies of the repeat appear identical to the assembler, causing errors in the assembly.
- **Contaminants** in samples (eg. from Bacteria or Human).
- **PCR artefacts (eg. Chimeras and Mutations)**
- **Sequencing errors**, such as “***Homopolymer***” errors – when eg. 2+ run of same base.
- **MID’s (multiplex indexes), primers/adapters** still in the raw reads.
- **polyploid** genomes

Assembly algorithms

Overlap-Layout-Consensus - Find overlaps between all reads

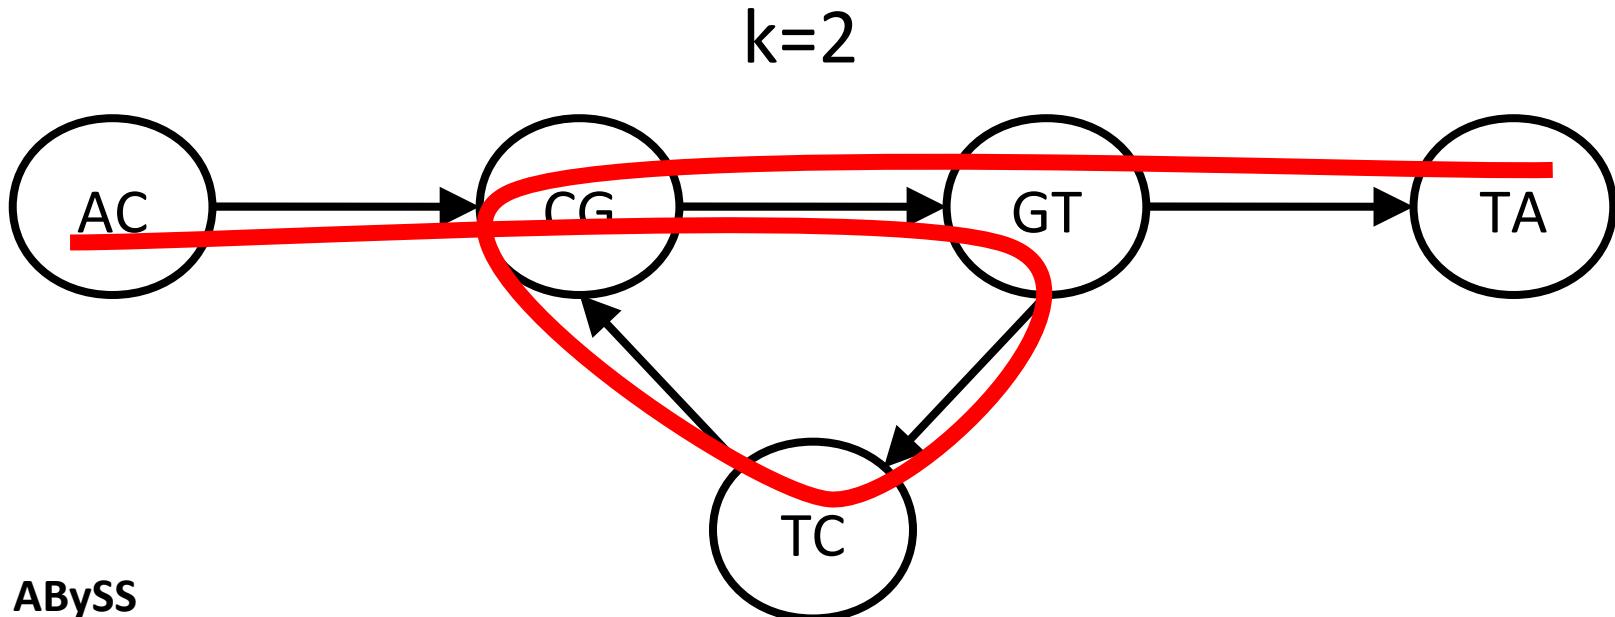

Problems caused by new sequencing technologies:

- ❖ Hard to find overlaps between short reads
- ❖ Impossible to scale up

Hands on training available at the

[Microbial Genomics & Metagenomics Workshop](#)

The Integrated Microbial Genomes (IMG) system ([Nucleic Acids Research, Vol 40, 2012](#))

serves as a community resource for comparative analysis and annotation of all publicly available genomes from three domains of life in a uniquely integrated context. Plasmids that are not part of a specific microbial genome sequencing project and phage genomes are also included into IMG in order to increase its genomic context for comparative analysis.

For details, see [IMG Release Notes](#) (Dec. 12, 2012), in particular the workspace and background computation capabilities available to IMG registered users.

Re-sequencing

Projects aimed at characterizing the genetic variations of species or populations

Resequencing of bacterial and archaeal isolates etc is possible if reference genomes are available

This approach can help to better understand bacterial community structure, gene function in bacteria under selective pressure

Climate change Studies

Increasing levels of carbon dioxide emission are thought to contribute to global climate change.

One way to decrease atmospheric carbon dioxide is to study the genomes of microbes that use carbone dioxidet as their sole carbon source

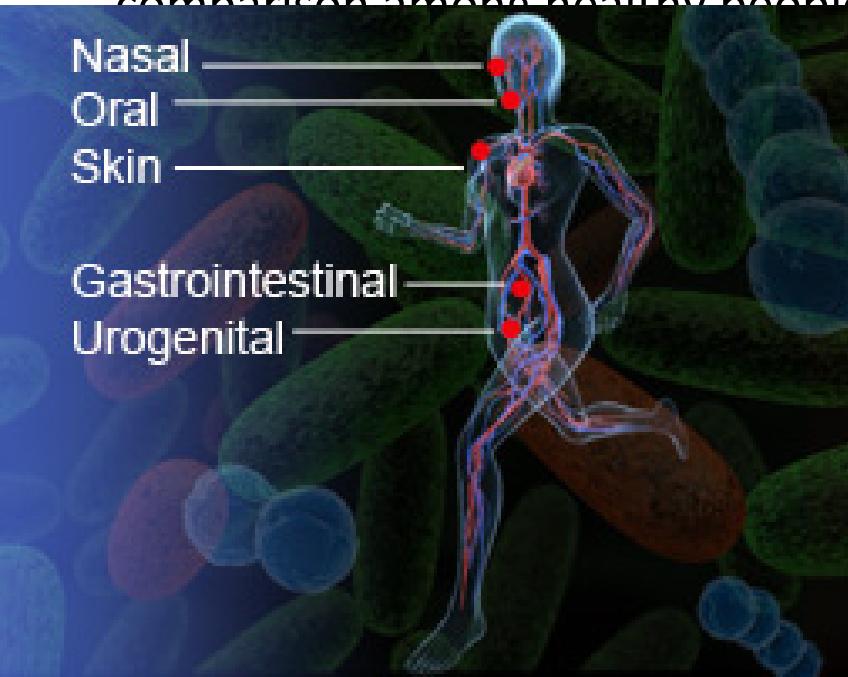

Human microbiome

MetaHIT - Europe

Human Microbiome Project –US

The human microbiome includes viruses, fungi and bacteria, their genes and their environmental interactions, and is known to influence human physiology.

There's very broad variation in these bacteria in different people and that severely limits our ability to create a “normal” microflora profile for comparison among healthy people and those with any kind of health issues.

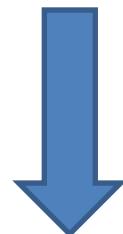

Children with **autism** harbor significantly fewer types of gut bacteria than those who are not affected by the disorder, researchers have found.

Prevotella species were most dramatically reduced among samples from autistic children—especially *P. copri*. (helps the breakdown of protein and carbohydrate foods)

Bioinformatics combining biology with computer science

- it can explore the causes of diseases at the molecular level
- explain the phenomena of the diseases on the gene/pathway level
- make use of computer techniques (data mining, machine learning etc), to analyze and interpret data faster
- to enhance the accuracy of the results

Reduce the cost and time of drug discovery

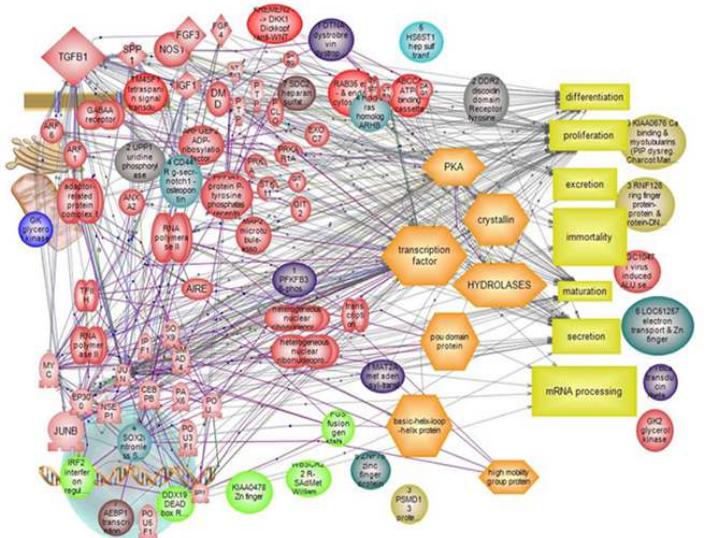

To improve drug discovery we need to discover
(read "develop") efficient bioinformatics
algorithms and approaches for

target identification

target validation

lead identification

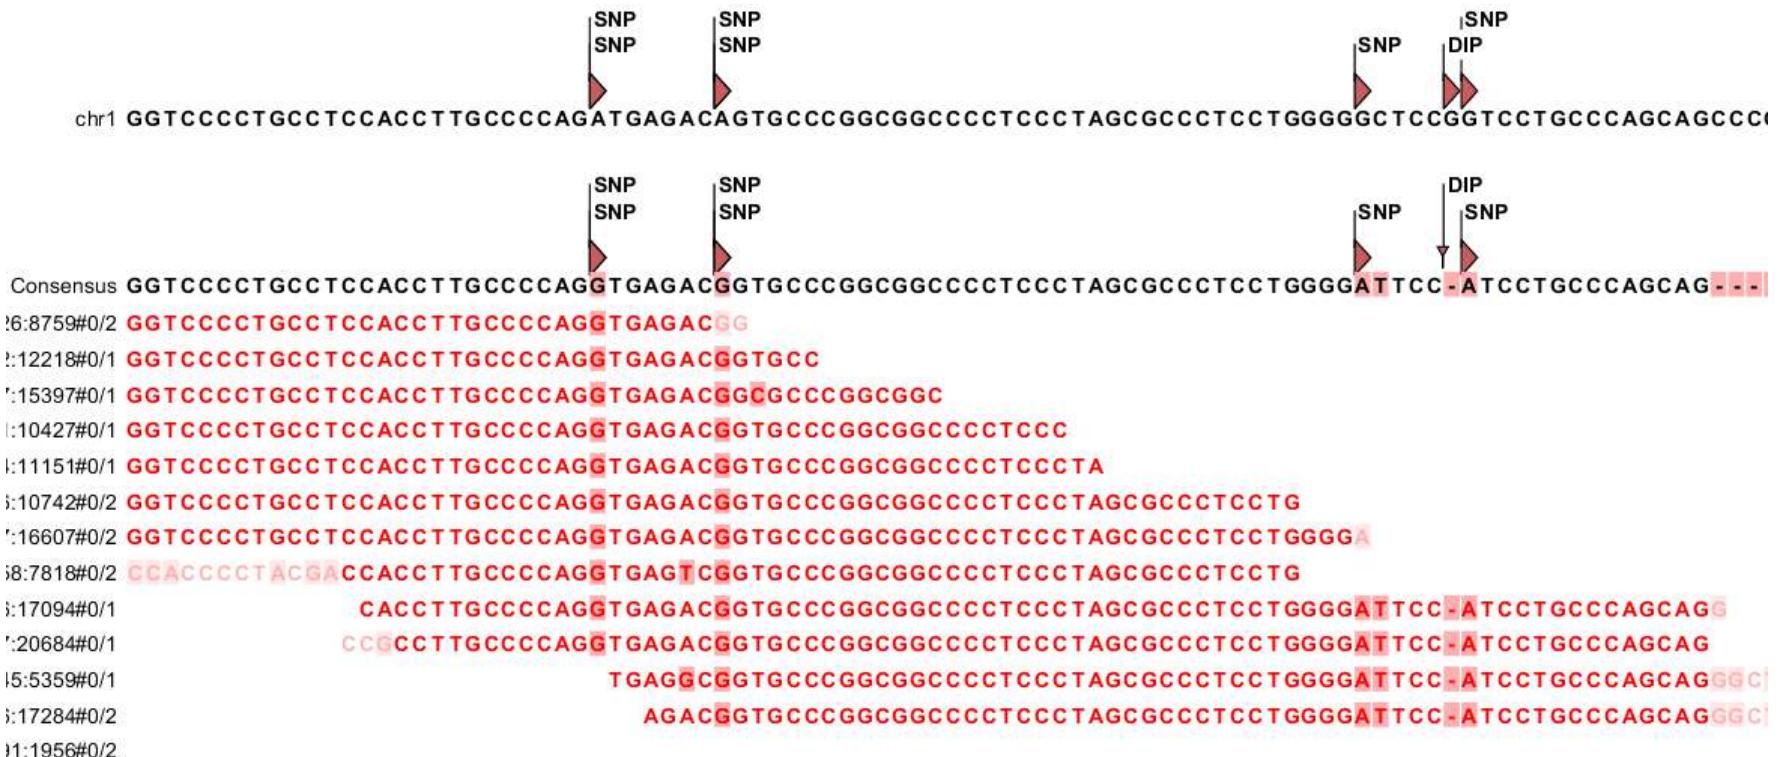

lead optimization

Advantages of detecting mutations with next-generation sequencing

- High throughput
 - Test many genes at once
- Systematic, unbiased mutation detection
 - All mutation types
 - Single nucleotide variants (SNV), copy number variation (CNV)-insertions, deletions and translocations
- Digital readout of mutation frequency
 - Easier to detect and quantify mutations in a heterogeneous sample
- Cost effective precision medicine
 - “Right drug at right dose to the right patient at the right time”

Homozygous SNPs and indel

Poor alignment

Missed SNP?
